Overview

Section 21.1

Completed

< back to module

This module is a basic introduction to programming in Python, a high-level language. We will first cover what a computer program is and how it works, before delving into writing basic programs. The content we will cover includes:

- What is a computer program?
- What different kinds of programming languages are there?
- What is Python?
- Running Python programs.
- Printing text to the screen.
- Variables.
- Manipulating string variables.
- Manipulating number variables.
- How to convert types of variables to other types.
- Lists, and how to modify them.
- Dictionaries, and how to modify them.
- Code comments.
