

How to set up on-screen keyboard with a different script

How to set up on-screen keyboard with a different script

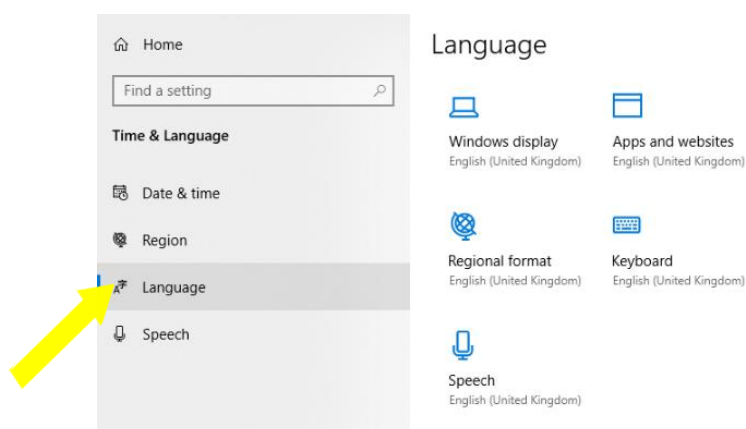

1. From the Windows menu open **Settings**.

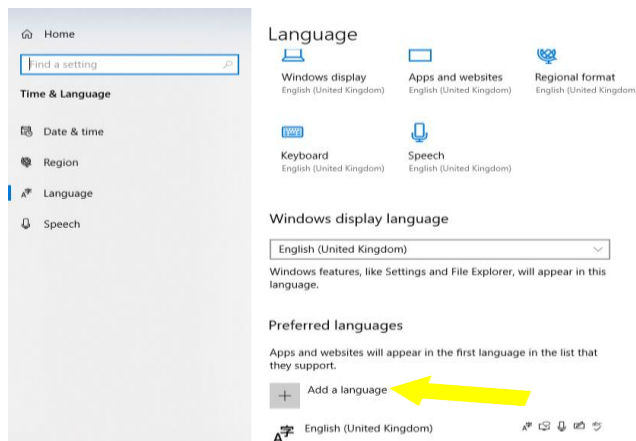

2. Click on the **Time and Language** tile.

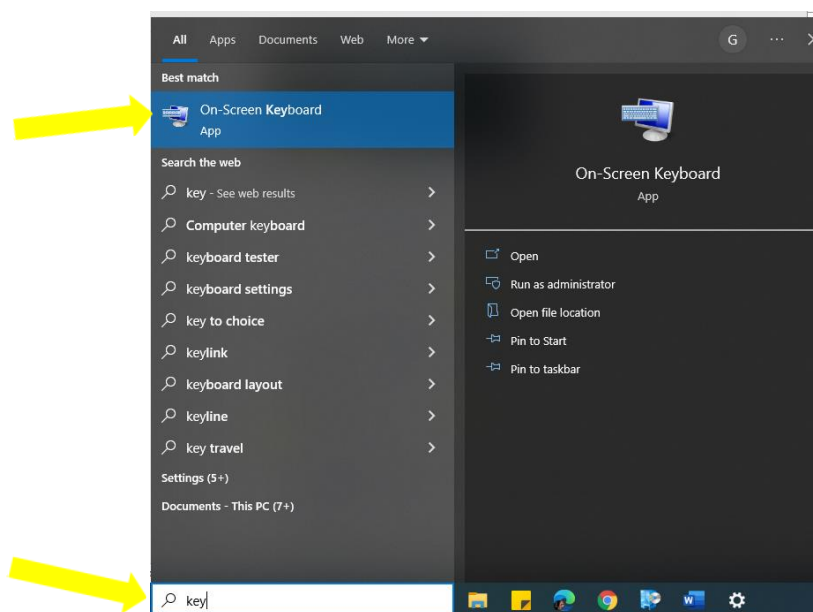

3. From the menu on the left-hand side pick **Language**.

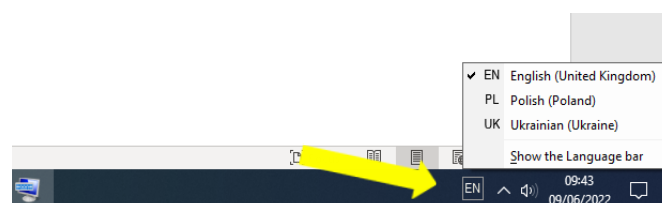

4. Scroll down the page and choose **Add Language** and choose the language you need from the menu and click **INSTALL**.

5. In the Windows Search box type on-screen Keyboard and pick **On-Screen Keyboard App** and then **OPEN**.

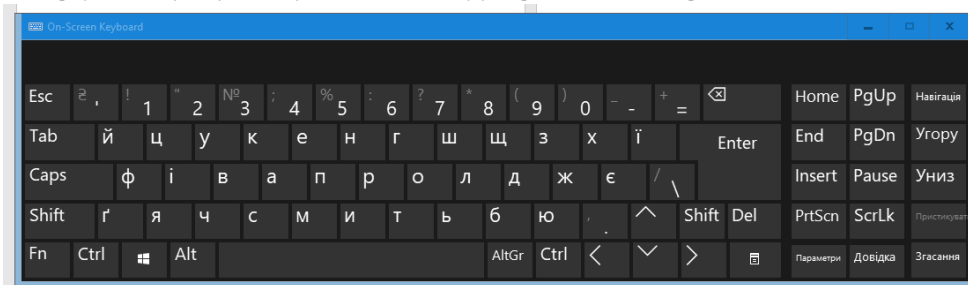

6. When the menu shows on your screen go to the bottom right corner, click on the symbol of the language (ENG in most cases) and choose one of the installed languages.

7. Your On-Screen Keyboard (as well as your laptop's keyboard) will now type using the script of your chosen language.

☺ Each language has a slightly different layout of the keyboard therefore using your *laptop's keyboard* for typing at this stage is not recommended

- Remember to change the language back to English after you have finished using the on-screen keyboard by going back to the bottom right corner and clicking on the symbol of the language (if your On-Screen Keyboard is set to the Ukrainian language you will see the letter UK) and choosing English from the menu.
