

The Kite and Rhombus

The kite and the rhombus share the same property: that the diagonals cross at right angles. It is this property that leads to the formula for the area of the shapes.

Draw a kite on squared paper. Draw in the diagonals. Move the diagonals to the edge of the kite to form a rectangle around the kite. The rectangle has the same length and width as the diagonals of the kite. Therefore the area of the rectangle is *the product of the diagonals*. By counting squares you can see the kite is half the area of the rectangle.

The area of the kite is half the product of the diagonals.

Draw a rhombus on squared paper to show that this is true for a rhombus.

A. Find the area of the following kites and rhombuses. (Diagrams not to scale).

Example: Find the missing diagonal length in the kite.

Area of kite = half the product of the diagonals

$$45 = \frac{1}{2} \times 9 \times x$$

$$45 = 4.5 \times x$$

$$x = \underline{10\text{ cm}}$$

where x is the missing diagonal

(Divide both sides by 4.5)

Area = 45 cm^2

B. Find the missing diagonal lengths in the following kites and rhombuses. (Diagrams not to scale).

1). Area = 42 cm^2 2). Area = 432 m^2 3). Area = 126 mm^2 4). Area = 768 m^2 5). Area = 243 cm^2

6). Area = 248 mm^2 7). Area = 429 cm^2 8). Area = 891 m^2 9). Area = 1365 mm^2 10). Area = 2976 m^2
