Acknowledgement

This Code of Practice is based on 'Safety in Microbiology' and its post-16 supplement published by the former Strathclyde Regional Council. The contribution of the committee that produced that original guidance is gratefully acknowledged. It is a tribute to the quality of their work that much of that original Code of Practice has stood the test of time and is applicable to the present day. The contribution of Jim Stafford who chaired the original Strathclyde committee and who led the review that produced this current edition is gratefully acknowledged.

This publication may be reproduced in whole or in part for bona-fide educational purposes provided that no profit is derived from the reproduction and that, if reproduced in whole or in part, the source is acknowledged.

Third edition published 2012.

Introduction

Practical work with micro-organisms

Practical work involving micro-organisms is of considerable educational value. It lends itself to investigative work in science and to the discipline of developing competence in practical skills. Microbiological skills are key components in the field of biotechnology and in the medical industries and services. The applications of microbiology are relevant to the everyday concerns of citizens in relation to food production, hygiene and health. It also allows for the evaluation and control of risk, a valuable life skill, as well as providing an insight into an area of science in which Scotland is a major global contributor in research and industrial production. In the 21st century responsible citizens will need to evaluate scientific issues related to microbiology and to develop informed views on the use and applications of micro-organisms.

Scope of the Code of Practice

This code is designed to cover most of the microbiology work likely to be carried out in Scottish secondary schools. Some microbiology work carries very little, if any, risk and is therefore also suitable for primary schools (designated as level 1 work in this code). Equally much of the microbiology work covered by this code is appropriate for courses covered in further education.

Risk assessment

Practical work involving micro-organisms includes hazards (sources of harm or danger). These include the potential:

- for infection with a disease causing organism (pathogen), or
- for the work to cause an allergic reaction.

Individuals with a reduced resistance to infection may be at particular risk from such hazards. The proportion of such individuals in the population at large would seem to be increasing. This may partly be because diseases causing immuno-deficiencies are now more common and partly because certain medical treatments are more commonly prescribed, including the use of chemotherapy and of immuno-suppressant drugs.

It is the probability of harm being realised in practice that defines the degree of risk. Teachers

and technicians must be aware of the risks in educational microbiological work and of the procedures that are to be followed in order to minimise them. This Code of Practice offers a set of preventive and protective measures produced as a result of model risk assessments. As such it can be adopted so as to meet the requirements of the COSHH Regulations and of other related health and safety legislation.

It is the responsibility of the teacher or technician to identify the risks in any practical activity and then to consider adopting the Code of Practice as being suitable and sufficient to control these risks. By following the Code of Practice in this way a risk assessment is being carried out. If an activity falls outwith the guidance in the Code of Practice then an individual risk assessment for that activity must be carried out. It is not the intention of the code to be restrictive. In any event the employer's guidance on assessing risk and recoding risk assessments should be followed.

Central principles of the Code of Practice

Central to the code is the concept of levels of work, whereby practical work for a particular level is determined by a combination of risk factors which include the:

- choice of micro-organisms;
- growth media used;
- choice of a suitable inoculum;
- incubation conditions;
- scale of operations;
- handling operations permitted;
- degree of containment;
- teacher training;
- availability of trained technicians;
- age of the learners;
- available resources.

There are three levels of work. In general, these levels are related to the educational stage of the learners. Thus in primary school only level 1 work should be attempted; in secondary schools, learners will normally be restricted to work at level 1 or level 2 in their broad general education, whilst in some national courses in the senior phase learners may, in addition, participate in level 3 work. Technicians and teachers who prepare materials for level 2 work should be trained to level 3 as they will have to carry out level 3 tasks.

Bioreactors (fermenters)

The use of bioreactors increases the potential risks involved in microbiology since larger volumes of liquid culture medium are used. For this reason, the choice of organisms and procedures which are permitted for use in bioreactors is more limited than that for small scale operations. Here the term bioreactor is used to refer to vessels other than Petri dishes or McCartney bottles and Universal containers in which micro-organisms are grown in liquid medium. A wide range of vessels from simple flask or bottle like containers to growth systems with elaborate sensing and control devices can be used as bioreactors.

The educational value of using bioreactors includes the following applications.

Applications which demonstrate:

- the use of growth vessels which simulate those used in commercial biotechnology;
- the culturing of an organism for biomass production.

Applications which allow studies of:

- the effect of various factors on growth of the organism e.g. temperature, pH, aeration;
- production of a product e.g. ethanol, specific proteins;
- where appropriate, datalogging and process control;
- batch, 'fed-batch' and continuous fermentation processes;
- the activity of enzymes or cells in an immobilised state or in an aqueous state.

Given sensible precautions, the educational value of these activities far outweighs the small degree of risk then involved.

Updates

This document is available in electronic format on, and available for download from, the SSERC website: www.sserc.org.uk. Any updates to the guidance will be posted on the site and notification thereof given in SSERC newsletters and/or Bulletins.

General Safety Considerations

The general principles and considerations upon which this document is based are outlined below.

- 1.1 All microbiological materials, cultures, media, environmental samples etc. from whatever source should be treated as though they were a potential source of pathogens.
- 1.2 The chance of contamination of the medium in which micro-organisms are growing and/or of micro-organisms escaping from the medium to the environment must be minimised.
- 1.3 Only a limited range of species and strains of micro-organisms may be used for each level of work (see appendices 1 to 4).
- 1.4 The use of growth media that may encourage the growth of pathogens is generally prohibited.
- 1.5 Sources of environmental samples for study are restricted.
- 1.6 The conditions under which micro-organisms may be grown are restricted.
- 1.7 The handling operations which may be undertaken with micro-organisms are limited.
- 1.8 The level of work with micro-organisms that a teacher or technician may undertake will be limited by the training that the teacher or technician has undergone.
- 1.9 The level of work with micro-organisms that may be undertaken in an educational establishment will be limited by the resources at hand and by the availability of trained staff in that establishment.
- 1.10 As a result of the limits which are placed on work at level 1 and level 2, protective clothing is not essential for work at these levels. Suitable protective clothing (e.g. lab coat) is required for level 3 work.
- 1.11 Preparation, sterilisation and disposal of microbiological materials should not be carried out by learners other than as part of a supervised and structured learning activity.
- 1.12 If teachers or technicians require to use micro-organisms outwith those named in this document, or to depart from the procedures herein, then a separate risk assessment of the proposed procedures must be carried out. SSERC can provide advice on assessing such risks.

It is appropriate to define three levels of working with micro-organisms, which might be encountered in schools, according to the risks which they present and the type of training required before teachers and technicians should embark upon them. (Note that these are not the same as the 'levels of containment' as used by professional microbiologists.)

Work at Level 1

The only micro-organisms permitted for use at this level are those which carry little, if any, known risk and which may be used in experiments by teachers with no specialist training. These can be disposed of safely using good domestic practices. Faulty technique may prevent educational ends being met, or lead to the demise of the micro-organisms used. It is unlikely, however, to place pupils or staff at any significant risk.

- 2.1 Only micro-organisms from Appendix 1 may be used.
- 2.2 No specialist training is required.
- 2.3 No specialised facilities or equipment are required.
- 2.4 Normal good domestic hygiene measures must be used.
- 2.5 The use of living micro-organisms in the preparation of food to be eaten must not be carried out in classrooms or laboratories. Such preparations (of e.g. yoghurt) must be carried out only in rooms where food is normally prepared or where suitable clean and hygienic work surfaces can be temporarily arranged.
- 2.6 The natural spoilage of plant material (e.g. fruit) may be observed provided the material is kept in a loosely stoppered container which can be disposed of unopened in a refuse bin.
- 2.7 The spoilage of animal material (e.g. meat, meat products) must not be studied.

Work at Level 2

Work at level 2 can involve a wider range of recommended micro-organisms and inoculation techniques and involves the use of sterile media and sterile equipment.

- 2.8 For small scale microbiological work at level 2 (e.g. using Petri dishes and/or McCartney bottles or Universal containers) only micro-organisms named in Appendices 1 and 2 can be used.
- 2.9 Where larger volumes of culture medium are used (e.g. in a bioreactor [fermenter]) then only micro-organisms with "unusual" growth requirements such as those requiring high salt or acid conditions can generally be used. This allows for growth of the intended micro-organism at the expense of undesirable contaminants.

Appendix 4 gives the names of permitted micro-organisms and their special growth conditions including the temperature range for use with fermenters.
- 2.10 Normal laboratory facilities (including hand washing) and specialised facilities for the preparation of media and disposal of cultures are required. (See section 3 on resources).
- 2.11 Autoclaving is the preferred method of sterilisation of equipment. Only where it is impractical to autoclave (e.g. due to the properties of the materials used in construction of the equipment or because of its size) may chemical disinfection be used.
- 2.12 Protective clothing is not essential.
- 2.13 All sterilisation required for level 2 work is a level 3 task (see 2.22).

- 2.14 Transfer of prepared sterile medium to sterile culture vessels is permitted.
- 2.15 Samples taken from solid cultures of Appendix 2 micro-organisms can be used to inoculate sterile solid or sterile liquid medium.
- 2.16 Samples of Appendix 1 and Appendix 4 micro-organisms taken from liquid cultures by inoculating loop can be used to inoculate sterile solid medium or sterile liquid medium in small scale culture.
- 2.17 At level 2, samples may be taken from a freshly prepared yeast suspension with a clean cotton bud to inoculate sterile solid media suited preferentially to the growth of yeast. Learners may also inoculate sugar solutions with yeast cells for large scale liquid culture work.
- 2.18 Removal of liquid samples from a fermenter, with the exception of yeast and sugar solutions, must only be carried out by a person trained to perform level 3 tasks.
- 2.19 Samples from carefully chosen areas of the environment may be used, but only to inoculate sterile solid media.
- 2.20 All cultures, irrespective of source, must be kept closed during incubation and subsequent examination.
- 2.21 Teachers of level 2 work must be trained in dealing with spillages.
- 2.22 In order that teaching at level 2 may be safely carried out, personnel trained at level 3 must be available for the supervision and performance of those level 3 tasks that are relevant to the level 2 work.

Work at Level 3

- 2.23 The following level 3 tasks are normally required to be carried out in an establishment in support of level 2 work:
- order, receipt, labelling and storage of cultures;
 - preparation of sterile media and sterile equipment;
 - sub-culturing;
 - sampling from bioreactors;
 - sterilisation and disposal of cultures;
 - sterilisation of used equipment;
 - management of incidents of spillage;
 - staining of incubated plates (e.g. starch agar [3]).
- Work at level 3 can involve additional micro-organisms and a wider range of inoculation and transfer techniques.
- 2.24 For small scale microbiological work at level 3, micro-organisms from Appendices 1 to 4, inclusive, may be used.
- 2.25 For larger scale microbiological work (e.g. in a bioreactor) only those organisms from Appendix 4 grown under their special growth conditions may be used.
- 2.26 Suitable protective clothing (e.g. lab coat) must be worn.
- In particular, samples must not be taken for culture from:
- human [1] or other animal body surfaces;
 - body fluids and secretions;
 - animal cages or aquaria;
 - lavatories;
 - faecal material;
 - poultry, eggs or areas which have been in contact with poultry;
 - meat or meat products;
 - dead animals;
 - milk which has not been pasteurised;
 - soft, unpasteurised, cheeses;
 - water sources likely to contain faecal or sewage pollution;
 - soil fertilised by animal manure or fouled by animal faeces;
 - mud [2] (e.g. from a pond or field).

[1] The classic 'finger dabs' experiments on washed and unwashed human hands may be carried out provided that only sterile plates are used and they remain closed after inoculation and through to disposal.

[2] The anaerobic conditions in mud may suit the growth of pathogenic organisms.

[3] Uninoculated starch agar plates used for enzyme studies may be opened and stained by students. Where starch agar plates have been inoculated with a micro-organism, only a level 3 trained person may open and stain the plates.

2

- 2.27 An autoclave may be used by learners under the supervision of a teacher or technician trained at level 3, but not on a routine basis.
- 2.28 Samples taken from solid cultures of micro-organisms from Appendices 1 to 4 can be used to inoculate sterile solid or sterile liquid medium.
- 2.29 Samples taken from liquid cultures of micro-organisms from Appendices 1 to 4 can be used to inoculate sterile solid or sterile liquid medium.
- 2.30 Samples may be removed from bioreactors under the supervision of a teacher or technician trained at level 3. Because of the risks from contaminants, samples must not be removed after the culture has ceased active growth nor if the specified culture conditions have changed. Exceptions to this specific requirement would include:
- growth curve investigations which have to be continued beyond the 'log' phase to establish the complete 'S' shaped growth curve, and
 - investigations of diauxic growth with different substrates.

Resources Required for Microbiology

3

Before safe microbiological practice may be reasonably assured, certain resources are required for each level of work.

Resources required for Level 1 Work

- 3.1 Resources for good domestic hygiene are required.
- 3.2 Hand washing facilities, including a sink, soap, water, paper towels and a bin should be readily accessible.
- 3.3 A household disinfectant, suitable for wiping work surfaces, must be available.
- 3.4 A large, transparent container, which can be loosely stoppered, is most suitable for studying the spoilage of plant material.
- 3.5 A sink is required for the disposal of liquid waste.
- 3.6 Access to normal solid refuse disposal facilities is required for the safe disposal of containers in which the natural spoilage of plant materials has been studied.

Resources required for Level 2 and Level 3 Work

- 3.7 Normal laboratory facilities are essential. These include work surfaces, a sink and a gas supply.

Absorbent, or otherwise unsound, work-surfaces should not be used. If absorbent surfaces are covered with a non-absorbent material (e.g. waterproof backed bench covering), this would be acceptable. Varnished wooden surfaces in good condition are acceptable. Temporary work surfaces such as a set of separate, portable, laminated boards are also acceptable.

Handwashing facilities, including sink, soap, water, paper towels and a bin must be available. Suitable protective clothing (e.g. lab coat) is required for level 3 work.

- 3.8 Preparing work surfaces. For much work at level 2 it suffices that work surfaces are cleaned with hot water and detergent (or a surfactant disinfectant) prior to commencing

work. Freshly diluted 1% hypochlorite solutions (a good quality commercial bleach e.g. *Domestos*, *Chlorox* or laboratory sodium chlorate(I) [hypochlorite]) may also be used to disinfect non-absorbent surfaces but care must then be taken to avoid contamination of the skin or clothes. *Virkon* is a suitable substitute but is relatively expensive. Where *Virkon* is used in discard jars (see below), it is good practice to use a different disinfectant for swabbing work surfaces.

- 3.9 Any discard jars, used for contaminated used equipment, must contain freshly diluted *Virkon* at a concentration of 1% w:v.
- 3.10 Disinfectants which contain available chlorine [e.g. "Chlorox", sodium chlorate (1) (hypochlorite) or bleach] may be used in suitable dilution to surface sterilise plant material (e.g. beans, peas).
- 3.11 *Virkon* must be available for treating spillages and for adding to bioreactors after use.
- 3.12 Petri dishes should normally be of the disposable plastic type. If glass Petri dishes are used they must be sterilised for re-use by autoclaving or with dry heat. Where glass Petri dishes are re-used chemical disinfection is not acceptable for the purposes of sterilisation.
- 3.13 McCartney and, or, Universal bottles should be made of glass, with screw-top lids.
- 3.14 Where metal inoculation loops are used, they must be of the following design:

24 SWG nichrome wire should be bent around a match stick, making sure that the loop formed is fully closed. The overall length of the wire, including the loop, should be no more than 50 mm. Loops must be attached to metal "chuck" type holders.

(Loops conforming to the above design may be made, or they can be purchased from scientific suppliers. Sterile disposable plastic loops may also be used.)

3

- 3.15 Proprietary cotton buds may be used as inoculation swabs to sample the environment and to sub-culture freshly prepared yeast suspension.
- 3.16 Steam sterilisation is best carried out using a laboratory autoclave. A pressure cooker of the domestic type is also suitable but is better reserved for small-scale work.
- 3.17 Glass flasks (suitably thick-walled), demijohns or similar containers can be used as simple bioreactor vessels.
- 3.18 Reactor vessels must be constructed from robust material.
- 3.19 The design of bioreactor vessels should be such as to permit ease of cleaning.
- 3.20 The shape of bioreactor vessels should give stability in use. If necessary, the vessel should also be supported.
- 3.21 A tray which is large enough to contain any spillage from a bioreactor vessel is required. If possible, the tray should allow drainage into a sink or carboy.
- 3.22 Personnel trained for level 3 work are required in the establishment to allow level 2 work to be carried out.

Resources required for Level 3 Work

- 3.23 Personnel trained at level 3 must have access to the following additional resources, in order to prepare for, and support, level 2 work.
- A hard non-absorbent work surface (e.g. plastic laminate), which is away from direct sources of draughts.
 - Suitable protective clothing (e.g. lab coat).
 - An autoclave.
 - A spillage kit containing:
 - a screw-capped bottle containing a measured quantity of *Virkon* disinfectant with the correct volume of water needed to dilute it marked on the side;
 - a quantity of paper towels;
 - a pair of autoclavable tongs or a small plastic dustpan;
 - a pair of disposable plastic gloves;
 - an autoclavable waste disposal bag;
 - an autoclavable container, with suitable means of closure into which contaminated, broken glass may be easily transferred for sterilisation.

The spillage kit should be placed in a prominent site for ease and speed of access.

Good Practice in Using Micro-organisms

4

General

- 4.1 The 'precautionary' practice, of treating all microbiological materials as potential sources of harmful contaminants, forms the basis of good laboratory practice in microbiology.
- 4.2 Techniques for handling microbiological materials are described in Microbiological Techniques published by SSERC (www.sserc.org.uk).
- 4.3 When bioreactors are used for enzyme experiments, the substrate, product and/or the enzyme could be a suitable source of nutrients for the growth of micro-organisms. Therefore, the safety considerations which apply to the use of bioreactors with micro-organisms may be applicable also to enzyme experiments, particularly if carried out over extended periods, i.e. more than four hours.
- 4.4 All hand-to-mouth operations, including eating, chewing, drinking, smoking, sucking pens and pencils and licking labels are forbidden in any laboratory used for microbiology. The consumption of any product from a bioreactor is not permitted.
- 4.5 Everyone working with micro-organisms must wash their hands thoroughly, using soap and water, both before and after microbiology work.
- 4.6 Exposed cuts should be covered with waterproof dressings.
- 4.7 Long hair should be tied back.
- 4.8 Refrigerators or cupboards used for storage of micro-organisms and micro-biological material must not be used for storage of food or drink.
- 4.10 Only micro-organisms named in Appendix 1 can be used for work at level 1. These micro-organisms must be purchased from an approved supplier or culture collection.
- 4.11 Containers used for microbiology work must be clean.
- 4.12 Appendix 1 micro-organisms should be grown in an appropriate medium (e.g. sugar solution for yeast, UHT milk for yoghurt). Suppliers' instructions should be followed, where applicable.
- 4.13 The growth of micro-organisms should be carried out in covered containers (e.g. with aluminium foil covers or non-absorbent cotton wool plugs to prevent the escape of spores and/or to allow the release of any carbon dioxide produced).
- 4.14 The growth of micro-organisms should normally be carried out at room temperature and, except for yoghurt making, never above 30°C.
- 4.15 The growth of micro-organisms should be continued for the minimum time required to show the desired effect (usually no longer than 24-36 hours for bacteria and several days - possibly 1 week - for fungi).
- 4.16 Microscope slides, prepared using micro-organisms from Appendix 1, can be safely disposed of without being sterilised.
- 4.17 Liquid cultures should be poured down the sink and washed away with plenty of water.

Solid cultures (e.g. yeast dough) can be disposed of in the bin used for solid, domestic type, waste.
- 4.18 Containers should either be cleaned immediately after use or disposed of in the bin for solid refuse.

Good Practice at Level 1

- 4.9 Work surfaces must be cleaned using hot water and detergent or a household disinfectant, prior to starting work and after completion of the work.
- 4.19 The material chosen for the study of the spoilage of plants should be placed in a large, clean, dry, loosely-stoppered container. The container should be tightly stoppered before the contents are studied by pupils and the container disposed of unopened in the bin for solid refuse.

4

Good Practice at Level 2

4.20 Working surfaces should be wiped with hot water and detergent, or a surfactant disinfectant, before and after use.

Cultures

4.21 Where micro-organisms from Appendices 1, 2, 3 or 4 are used, they must be obtained from an approved supplier.

4.22 Cultures should be purchased specifically as and when required. Storage of cultures should be for the minimum time practicable.

4.23 Freeze dried cultures may be used but only where conventional slopes or other more easily handled forms are not offered by the approved supplier. The person opening the ampoules should be trained in the simple techniques necessary for this to be performed safely and without consequent contamination.

4.24 Purchased cultures should be dated on arrival and placed in a closed container in a refrigerator or cupboard, both of which should be labelled with Biohazard labels.

4.25 A log must be kept of all cultures showing:

- a) name of micro-organism;
- b) supplier;
- c) date of receipt;
- d) number of sub-cultures made;
- e) date of each sub-culture;
- f) by whom sub-cultures were taken;
- g) date of disposal.

4.26 All sub-culturing for level 2 work must be carried out by a person trained for level 3 work.

4.27 All cultures should be sterilised and disposed of by a person trained for level 3 work as soon as is practicable after use. At the end of the teaching programme all cultures (including the original stock cultures) should normally be sterilised and safely disposed of.

4.28 Under no circumstances should any culture be kept for longer than one year.

4.29 Only sterile milk inoculated with dried yoghurt bacteria may be re-opened (e.g. to measure pH). Milk may only be

inoculated with dried yoghurt bacteria: *Lactobacillus bulgaricus*, *Lactobacillus lactis* or *Streptococcus lactis*.

4.30 Where possible, fungi that produce large numbers of air borne spores should be handled before sporulation occurs. This is particularly important for some species, e.g. those of *Aspergillus* and *Penicillium* which produce large numbers of easily dispersed spores and to which serious allergic reactions can occur.

Media

4.31 Enriched, or selective, media which may encourage the growth of pathogens must not be used. This includes media such as blood agar, bile salts, McConkey's agar, dung or faecal agar and corresponding broths or media which use animal sera or blood.

4.32 Antibiotics should not normally be incorporated into growth media and only commercially produced paper impregnated antibiotic discs should be used. (But see Appendix 3 on the use of antibiotics in specific protocols).

4.33 The volume of culture medium should be no larger than is necessary to carry out the investigation.

4.34 Media for use in Petri dishes should be cooled in a thermostatically controlled water bath at 55°C before pouring. The necks of media containers should be flamed before pouring.

4.35 When introducing sterile media from a McCartney bottle or Universal container into an empty sterile Petri dish, the following procedure should be observed:

- a) the Petri dish should be placed lid uppermost on the bench;
- b) the lid should be opened just enough to allow the operation and must be held in the hand, not placed on the bench;
- c) the lid must be opened for the minimum amount of time;
- d) the mouth of the McCartney bottle or Universal container must be flamed when the lid is removed, and - unless emptied - flamed again before the lid is replaced.

4.36 Prior to use agar plates must be inspected and contaminated plates discarded, sterilised and disposed of. The surface of the agar must be dry.

4.37 Plates with excessive condensation on the lids should be discarded.

Inoculation

4.38 Containers prepared for inoculation should be labelled with a self-adhesive label, or using a waterproof marker, stating:

- date of inoculation;
- nature of the inoculum;
- name of operator;
- nature of media.

4.39 Inoculating loops should be sterilised before being introduced into a culture. The entire length of the wire and loop, should be heated to red heat in a blue bunsen flame and allowed to cool, without coming into contact with any surface. The inoculation loop should be sterilised after use. Plastic disposable loops can only be used for one transfer and then must be placed in a discard jar containing *Virkon*.

4.40 The mouths of culture bottles should be flamed when lids are removed and flamed again before their replacement. Lids should not be placed on the bench. With practice it is possible to manipulate bottles, lids and loops without any of them leaving the hands. Should a lid fall to the bench or floor, it should be replaced and the bottle sterilised and contents safely disposed of.

4.41 Cotton buds must only be used for sampling from the environment and must not be used for culture transfer work other than for a freshly prepared yeast suspension. Cotton buds must only be used as swabs for inoculating agar media in Petri dishes. Used cotton bud swabs should be held in a discard jar prior to their safe disposal.

4.42 Petri dish lids should be opened for the minimum amount of time necessary to complete the inoculation procedure.

4.43 Once inoculated, the lids of McCartney bottles or Universal containers should be tightened.

4.44 Once inoculated, each Petri dish must be sealed diametrically, using transparent adhesive tape and incubated base uppermost.

4.45 When introducing antibiotic discs to freshly inoculated Petri dishes, the following procedure should be observed:

- only commercially available paper impregnated antibiotic discs may be used;
- the Petri dish should be placed lid uppermost on the bench;
- the lid should be opened just enough to allow the operation and must be held in the hand, and not placed on the bench;
- the lid must be opened for the minimum amount of time;
- antibiotic discs must be transferred to the Petri dish with sterile forceps;
- after the transfer operation, the forceps must be flamed or placed in a discard jar;
- the Petri dish should be taped and thereafter must never be re-opened;
- on completion of observations, the Petri dish must be autoclaved and disposed of.

Incubation

4.46 In case of spillage, bottles containing inoculated liquid medium should be placed in a secondary container during incubation.

In experiments which involve production of biogas (e.g. methane), there is a potential for build-up of flammable gases. Therefore, eye protection must be worn, and a safety screen should be used.

4.47 Areas of restricted access to students must be used for all incubations.

4.48 Incubations are not normally to be carried out above 30°C; exceptions to this are given in Appendices 3 and 4.

4.49 No incubation should be continued for a longer time than is essential to obtain the required result.

4.50 After incubation, containers should not be re-opened.

4

Bioreactors (fermenters)

- 4.51 Bioreactor vessels should be inoculated with an actively growing inoculum to reduce the risk of a contaminant becoming established. This inoculum should be a significant fraction (e.g. 10-20%) of the total volume of the medium.
- 4.52 Experiments to demonstrate biogas production should only use plant substrates (e.g. crushed beans) and must have no other added inoculum or enrichment media.
- 4.53 Electrical equipment should be sited at a safe distance from the bioreactor vessel and wet working areas whenever possible. Care should be taken to keep bioreactor mains, air and water feed lines tidy.
- 4.54 Mains powered electrical apparatus used with a bioreactor system must be of commercial design, intended for school use and supplied by a reputable supplier. All such mains apparatus should be protected by a safety 'cut out', i.e. an appropriate residual current circuit breaker. All other apparatus should operate from a power pack with a maximum output of 25 volts.
- 4.55 The bioreactor system should be located to avoid the possibility of accidental or deliberate interference.
- 4.56 The bioreactor must be set in a tray which is large enough to contain any spillage. If possible, the tray should drain into a sink or carboy.
- 4.57 The bioreactor vessel lid (where applicable) must have an airtight fit and should be secured, to prevent accidental opening of the vessel.
- 4.58 Ports holding probes or other inserts in bioreactors must be effectively sealed.
- 4.59 Unused bioreactor ports must be effectively stoppered.
- 4.60 Where a rotating stirrer bar or impeller is fitted to a bioreactor, all probes and inserts should be carefully positioned so as to avoid mechanical damage from such agitation devices.
- 4.61 The bioreactor vessel must be adequately vented to prevent the build up of pressure. A wine-making trap or substantial non-absorbent cotton wool plug should be sufficient to trap any fine spray in a simple bioreactor (e.g. a flask or demijohn).
- 4.62 Where bioreactors have air inlet lines, these must be fitted with an in-line filter.
- A bacteriological filter or glass tubing packed with 75 mm of non-absorbent cotton wool is recommended. Filters must be sterilised before and after use. Filters should be replaced after each use, or in accordance with manufacturers' instructions.
- Any exit air lines or vents must also be fitted with an in-line filter, as specified above. Such exit air lines or vents must be positioned vertically above the culture vessel, to prevent condensation blocking the air-line or filter.
- Attention must be given also to the possibility of siphoning-back in air-lines. They must be so positioned as to avoid the possibility of a siphon or be fitted with a non-return valve.
- 4.63 In bioreactors with high aeration levels, or temperatures over 30°C, excessive water loss can be overcome by fitting a condenser (vertically) between the growth vessel and the exit air filter.
- 4.64 Excessive foam formation in bioreactors must be avoided. It may lead to the blocking of the exit air line (air vent) and cause build-up of excess pressure. Foaming can be avoided by the addition of one drop of silicone anti-foaming agent.

Immobilised cells

- 4.65 For experiments with immobilised cells, micro-organisms must only be selected from Appendix 1.

Disposal

- 4.66 Microscope slides, prepared using micro-organisms from Appendix 2, must be placed in a discard jar, with an appropriate disinfectant, before being disposed of.
- 4.67 Arrangements should be made for the return of all microbiological materials for sterilisation and disposal.

Spillages

- 4.68 If a gross spillage occurs (e.g. from a bioreactor vessel), the room must be cleared immediately and no one should re-enter the room for thirty minutes. A person trained for level 3 work must be informed immediately.
- 4.69 Small scale spillages (e.g. from McCartney bottles or Universal containers, or breakages of Petri dishes) must be covered with paper towels soaked with *Virkon* for at least ten minutes before being cleared away by a person trained for level 3 work. Care should be taken to avoid inhalation of any aerosol cloud formed by the spillage. Spillages on skin and clothing must be washed with soap and water.

Level 3 Tasks Required to Support Level 2 Work

Sterilisation

- 4.70 All vessels and other apparatus must be sterilised before and after use.
- Sterile media and equipment should be prepared by autoclaving at 121°C for 15 minutes (thus giving a pressure of 103 kNm⁻² or 15 lbf in⁻² steam pressure) or at 126°C for 10 minutes. No single container of liquid medium should contain more than 500 cm³ unless the holding time is suitably prolonged and sterility is checked. A *Browne's* tube or other time/temperature indicating device, with an appropriate range, should be included in the load when an autoclave is brought into use after a period in storage, and occasionally thereafter. (An autoclave is a designated *control measure* in terms of COSHH requirements and its efficacy must be checked at sensible intervals).

Media for use in fermenters should be sterilised by use of an autoclave, as above, or by following manufacturers' instructions.

- 4.71 Items of equipment which cannot be steam sterilised can be decontaminated by the use of chemical disinfectants, e.g. a hypochlorite solution or *Virkon*.
- 4.72 Glassware which cannot be conveniently autoclaved may be sterilised by dry heating in an oven maintained at 160°C for two hours.

Sub-culturing

- 4.73 Sub-culturing should be carried out only for immediate requirements and kept to the minimum necessary for level 2 work to take place.
- 4.74 Freshly inoculated Petri dishes, for use with antibiotic discs, should be prepared by using a sterile pipette or sterile dropper to transfer a few drops of a liquid culture of organisms from Appendix 2 to a sterile agar plate. The inoculum should be spread using a sterile spreader (lawn plate).

Disposal

- 4.75 All microbiological materials should be sterilised by autoclaving before disposal.
- 4.76 Sterilised liquid waste should be flushed away with a large volume of water. Glassware should then be washed out immediately.
- 4.77 Used Petri dishes should be autoclaved in disposable autoclavable bags which are loosely tied. Only after autoclaving should these bags then be sealed and placed in a refuse bag before disposal in a refuse bin. It is critical that Petri dishes are loosely packed in the bags and that the autoclave as a whole is not overloaded. If these requirements are not met, then air may not be properly displaced and sterilisation cannot be ensured.

4

Spillages

4.78 Spillages should be treated as below.

- Action as detailed in 4.68 and 4.69.
- A lab coat and disposable gloves must be worn.
- The debris should be picked up with autoclavable tongs and put into an autoclavable bag or swept into a plastic dustpan using paper towels.
- All contaminated debris and paper towels must be autoclaved before disposal.
- The tongs or dustpan must be autoclaved or covered with a hypochlorite solution, or a solution of *Virkon*, for 24 hours.
- Fluids into which serial dilutions are made must be sterile.
- Where liquid inoculum is to be spread over plates of solid medium, any spreader to be used must be sterile (an alcohol flamed, glass spreader or a sterile disposable type).

Additional Requirements for Good Practice at Level 3

Cultures

4.79 Where micro-organisms from appendices 1, 2, 3, or 4 are used, they must be purchased from an approved supplier or recognised culture collection.

4.80 All sub-culturing for level 3 work must be carried out by a person trained for level 3 work. (Note that post-16 students may be trained to carry out a range of level 3 tasks).

Inoculation

4.81 When using pipette transfer to inoculate Petri dishes the following procedure should be observed.

- Sterile disposable plastic pipettes may be used.
- Glass pipettes should have a non-absorbent cotton wool plug inserted in the wide end before being sterilised in a closed container.
- Material should be drawn in and expelled from the pipette by means of a bulb or similar device. Mouth pipetting must not be carried out.
- Care must be taken to avoid aerosol formation (e.g. by not generating bubbles).
- Used pipettes must be placed into a container of *Virkon*. Any contaminated bulbs should be disinfected and then sterilised by autoclaving. Glass pipettes also may then be autoclaved and cleaned before storing. They must be autoclaved

again before re-use. Disinfected disposable plastic pipettes, however, must not then be re-used for any purpose.

Incubation

4.82 Cultures inoculated and incubated on solid media may be opened by a student only after the following conditions have been met:

- The solid medium was inoculated from a culture (or a mixed culture) of micro-organisms from appendices 1, 2, 3 or 4, prepared by a person trained for level 3 work.
- The incubated cultures have first been visually checked for contamination by a person trained for level 3 work.

Bioreactors (fermenters)

4.83 A bioreactor may be set up, sterilised as appropriate before use and inoculated with an organism from Appendix 4 by a student under the supervision of a teacher or technician trained to level 3.

Spillages

4.84 Gross spillages must not be dealt with by learners (4.68, 4.69). Learners should be trained to deal with small-scale spillages and may also experience, through simulation, the problems associated with tackling incidents on a larger scale.

Sterilisation

4.85 Sterile media may be prepared by a learner under the supervision of a teacher or technician trained for work at level 3, but not on a routine basis.

Disposal

4.86 Cultures may be autoclaved and disposed of by a learner under the supervision of a teacher or technician trained for work at level 3, but not on a routine basis.

4.87 The chemical disinfection, and disposal, of bioreactor contents must be carried out only by a person trained for work at level 3.

Appendices

Selected micro-organisms for Scottish schools and colleges

The micro-organisms listed in Appendices 1 to 4 have been selected in order to give adequate coverage of current course work in Scotland. These organisms present minimal risks, given good practice. The organisms listed have been selected from fuller, revised, listings endorsed by a range of relevant organisations and first published by ASE. These fuller lists have also been published by SSERC in the Microbiological Techniques section of SafetyNet www.sserc.org.uk. The fuller listings also give points of educational use or interest and comment on the ease with which organisms can be cultured and maintained.

All micro-organisms named in Appendices 1-4 must be obtained from an approved supplier or obtained from a recognised UK culture collection (usually, but not always, more expensive).

It is important to note that it is not intended that the selected organisms in Appendices 1-4 should be considered as definitive, nor complete, lists. Further development of courses and projects, particularly at levels 2 and 3, may well require the use of micro-organisms which do not currently appear on the lists. Schools and colleges wishing to use micro-organisms not included in these lists, or to depart from the procedures in this code, must first carry out an appropriate risk assessment. SSERC is happy to assist in that process and to consider additions to these lists.

APPENDIX 1

Selected organisms for work at level 1

Breadmaking yeast (*Saccharomyces cerevisiae*)

Dried yoghurt cultures
(bacteria used to make yoghurt)

Blue-green algae

Green algae

Free living protozoa

Lichens

Slime moulds

APPENDIX 2

Selected organisms for work at levels 2 and 3

All micro-organisms listed in Appendix 1 and, in addition, the following organisms:

Bacteria	Fungi
<i>Acetobacter aceti</i> <i>Agrobacterium tumefaciens</i> <i>Azotobacter species</i>	<i>Agaricus bisporus</i> <i>Armillaria mellea</i> <i>Aspergillus oryzae</i> (strain CMI 044242) *
<i>Bacillus megaterium</i> <i>Bacillus stearothermophilus</i> <i>Bacillus subtilis</i>	<i>Botrytis cinerea</i> <i>Botrytis fabae</i>
<i>Cellulomonas species</i> <i>Chromatium species</i>	<i>Coprinus lagopus</i>
<i>Escherichia coli</i> (strain B or strain K12) <i>Erwinia caratovora</i> (also called <i>Pectobacterium carotovorum</i>)	<i>Fusarium graminearum</i> <i>Fusarium solani</i> <i>Fusarium oxysporum</i>
<i>Gluconobacter oxydans</i>	<i>Helminthosporium avenae</i>
<i>Janthinobacterium lividum</i> (also called <i>Chromobacterium lividum</i>)	<i>Kluveromyces lactis</i>
<i>Lactobacillus species</i>	<i>Mucor hiemalis</i> <i>Mucor mucedo</i> <i>Myrothecium verrucaria</i>
<i>Micrococcus luteus</i> (also called <i>Sarcina lutea</i>)	<i>Neurospora crassa</i>
<i>Photobacterium phosphoreum</i>	<i>Penicillium expansum</i> <i>Penicillium roquefortii</i> <i>Phaffia rhodozyma</i> (e.g. coloured organism) <i>Physalospora obtusata</i> <i>Phycomyces blakesleanus</i> <i>Phytophthora infestans</i> <i>Pleurotus ostearus</i> <i>Pythium de baryanum</i>
<i>Rhizobium species</i>	<i>Rhizopus oligosporus</i> <i>Rhizopus sexualis</i> <i>Rhizopus stolonifer</i> <i>Rhytisma acerinum</i>
<i>Rhodospseudomonas palustris</i>	<i>Saccharomyces cerevisiae</i> <i>Saccharomyces diastaticus</i> <i>Saccharomyces ellipsoides</i> <i>Saprolegnia litoralis</i> <i>Schizosaccharomyces pombe</i> <i>Sclerotinia fructigena</i> <i>Sordaria fimicola</i> <i>Sporobolomyces species</i>
<i>Spirillum serpens</i> <i>Staphylococcus epidermidis</i> <i>Streptococcus lactis</i> <i>Streptococcus thermophilus</i>	<i>Trichoderma reesei</i>
<i>Vibrio natriegens</i> (also called <i>Beneckea natriegens</i>)	
Viruses	
<i>Cucumber Mosaic Virus</i>	
<i>Potato Virus X</i> <i>Potato Virus Y</i> (not the virulent strain)	
<i>Tobacco Mosaic Virus</i> <i>Turnip Mosaic Virus</i>	

* CMI = Commonwealth Mycological Institute)

APPENDIX 3

Selected organisms for specific protocols

- *E. coli* strain B
- *E. coli* strain K12
- Bacteriophage

Notes on specific protocols using *E. coli*

- 1) Some *E. coli* strains are associated with health hazards. *E. coli* strains B and K12 are widely used laboratory strains that have lost the ability to colonise the human gut and so present a reduced risk compared to other strains of *E. coli*. These two strains of *E. coli* should be suitable for all projects which require the use of *E. coli*.
- 2) *E. coli* strain B is a suitable host for T 'phages, T1-T7, and λ 'phage.
- 3) *E. coli* strain K12 is suitable for self cloning experiments and for transformation protocols using pGLO plasmids. These protocols may involve incubation temperatures of 37°C and the use of media containing antibiotics. Although these conditions are outwith the Code of Practice, a suitable risk assessment can make such practical work suitable for schools. Suitable control measures to control risk are usually included in such protocols. SSERC can provide advice on suitable protocols and risk assessment.

APPENDIX 4

Selected micro-organisms and suggested culture conditions for large-scale work at levels 2 and 3 (e.g. with bioreactors)

Various inter-related factors influence the successful and safe operation of fermentation-type projects which involve the use of larger scale quantities of micro-organisms in bioreactors. Appropriate equipment and operational factors for this work have been described elsewhere in this document.

In Appendix 4 (see below), a range of selected micro-organisms is given, along with culture conditions which will favour the growth of a suitable large inoculum of the intended culture over the growth of possible undesirable contaminant organisms.

Selected Organisms	Temperature Range °C	Culture Conditions
<i>Acetobacter aceti</i>	25-30	Acidic medium containing ethanol
<i>Azotobacter vinelandii</i>	30-35	Nitrogen-free medium
<i>Chlorella</i> (a green alga)	20-25	Mineral medium exposed to light
<i>Gluconobacter oxydans</i>	25-30	Acidic medium containing ethanol
<i>Lactobacillus bulgaricus</i>	41-45	Acidic medium containing fermentable sugar(s)
<i>Lactobacillus lactis</i>	41-45	Acidic medium containing fermentable sugar(s)
<i>Methylophilus methylotrophus</i>	30-35	Mineral medium containing methanol
<i>Kluveromyces lactis</i>	25-30	Acidic medium containing fermentable sugar(s)
<i>Photobacterium phosphoreum</i>	15-20	High salt medium (optional, small amounts of glycerol)
<i>Saccharomyces cerevisiae</i>	25-30	Acidic medium or glucose solution
<i>Schizosaccharomyces pombe</i>	25-30	Acidic medium
<i>Vibrio natriegens</i>	30-35	High salt medium
