### **Polynomials**

A **polynomial** is an expression with terms of the form *ax*<sup>n</sup>, where n is a whole number.

For example,  $5p^4 - 3p^3$  is a polynomial, but  $3p^{-1}$  or  $\sqrt[3]{p^2}$  are not.

The degree of a polynomial is its highest power, e.g. the polynomial above has a degree of 4.

The number part of each term is called its **coefficient**, e.g. the coefficients of  $p^4$ ,  $p^3$  and p above are 5, -3 and 0 (as there is no p term!) respectively (note that  $5p^4$  would also be a polynomial on its own, with coefficients of zero for all other powers of p).

#### **Evaluating Polynomials**

remainder (if one exists). This process is known as synthetic division.

**Example 4:** Find the remainder on dividing  $x^3 - x^2 - x + 5$  by (x + 5).

#### Remainder Theorem and Factor Theorem

Considered together, these two theorems allow us to factorise algebraic functions (remember that a factor is a number or term which divides **exactly** into another, leaving **no remainder**).

If polynomial f(x) is divided by (x - h), then the remainder is f(h) On division of polynomial f(x) by (x - h), if f(h) = 0, then (x - h) is a factor of f(x)

In other words, if the result of synthetic division on a polynomial by h is zero, then h is a **root** of the polynomial, and (x - h) is a **factor** of it.

**Example 6:** 
$$f(x) = 2x^3 - 9x^2 + x + 12$$
.

a) Show that (x - 4) if a factor of f(x).

**Example 7:** Factorise fully  $3x^3 + 2x^2 - 12x - 8$ .

b) Hence factorise f(x) fully.

**Example 8:** Find the value of k for which (x + 3) is a factor of  $x^3 - 3x^2 + kx + 6$ 

**Example 9:** Find the values of a and b if (x - 3) and (x + 5) are both factors of  $x^3 + ax^2 + bx - 15$ 

### Solving Polynomial Equations

Polynomial equations are solved in exactly the same way as we solve quadratic equations: make the right hand side equal to zero, factorise, and solve to find the roots.

**Example 10:** The graph of the function  $y = x^3 - 7x^2 + 7x + 15$  is shown. Find the coordinates of points A, B and C.

## Finding a Function from its Graph

This uses exactly the same system as that for quadratic graphs, but with more brackets (see page 19).

**Example 11:** Find an expression for cubic function f(x).

# Sketching Polynomial Functions

**Example 12:** a) Find the x - and y - intercepts of the graph of  $y = x^4 - 6x^3 + 13x^2 - 12x + 4$ .

b) Find the position and nature of the stationary points of  $y = x^4 - 6x^3 + 13x^2 - 12x + 4$ .

c) Hence, sketch and annotate the graph of  $y = x^4 - 6x^3 + 13x^2 - 12x + 4$ .
