

Lesson(s)	..by the end of the lesson(s) I should know...
testes	<ul style="list-style-type: none"><li><input type="checkbox"/> sperm are produced in seminiferous tubules in the testes</li><li><input type="checkbox"/> the interstitial cells of the testes produce the hormone testosterone</li><li><input type="checkbox"/> the prostate gland and the seminal vesicles secrete fluids that maintain the motility and viability of the sperm</li></ul>
ovaries	<ul style="list-style-type: none"><li><input type="checkbox"/> ovaries contain the immature ova (eggs) in various stages of development</li><li><input type="checkbox"/> each ovum is surrounded by a follicle that protects the maturing egg and secretes hormones</li></ul>
fertilisation	<ul style="list-style-type: none"><li><input type="checkbox"/> mature ova are released into the oviduct where they may be fertilised by sperm</li><li><input type="checkbox"/> a fertilised egg forms a zygote</li><li><input type="checkbox"/> a zygote undergoes mitosis</li></ul>

Lesson(s)	..by the end of the lesson(s) I should know...
puberty	<ul style="list-style-type: none"> <li><input type="checkbox"/> the hypothalamus (in the brain) secretes a releaser hormone that targets the pituitary gland (below the brain), this triggers the onset of puberty</li> </ul>
males	<ul style="list-style-type: none"> <li><input type="checkbox"/> the pituitary gland in males, releases follicle stimulating hormone (FSH) and interstitial cell stimulating hormone (ICSH)</li> <li><input type="checkbox"/> in males, follicle stimulating hormone (FSH) promotes sperm production in the seminiferous tubules of the testes</li> <li><input type="checkbox"/> interstitial cell stimulating hormone (ICSH) stimulates the interstitial cells in the testes to produce the male sex hormone testosterone</li> <li><input type="checkbox"/> testosterone stimulates sperm production in the seminiferous tubules &amp; activates the secretion of fluids by the prostate gland and seminal vesicles</li> <li><input type="checkbox"/> high testosterone levels inhibit the secretion of FSH and ICSH, resulting in decrease production of testosterone by interstitial cells = negative feedback control</li> </ul>
females	<ul style="list-style-type: none"> <li><input type="checkbox"/> the pituitary gland in females releases follicle stimulating hormone (FSH) and luteinising hormone (LH)</li> <li><input type="checkbox"/> the menstrual cycle is a series of hormone controlled events from one menstruation to the next</li> <li><input type="checkbox"/> the menstrual cycle takes about 28days (day 1 = first day of menstruation)</li> <li><input type="checkbox"/> the menstrual cycle has two phases - 1<sup>st</sup> = follicular phase, 2<sup>nd</sup> = luteal phase</li> <li><input type="checkbox"/> in the follicular phase FSH stimulates the development and maturation of a follicle surrounding the ovum and the production of the ovarian hormone oestrogen by the follicle</li> <li><input type="checkbox"/> oestrogen stimulates the proliferation of the endometrium, and thins the cervical mucus (making it easier for sperm to swim through)</li> <li><input type="checkbox"/> when oestrogen levels are high, LH is released by the pituitary gland</li> <li><input type="checkbox"/> in the luteal phase, a surge of LH triggers ovulation and the subsequent development of the corpus luteum from the follicle</li> <li><input type="checkbox"/> LH also stimulates the corpus luteum to secrete the ovarian hormone progesterone</li> <li><input type="checkbox"/> progesterone promotes further development and vascularisation of the endometrium (ready for implantation if pregnancy occurs)</li> <li><input type="checkbox"/> high levels of oestrogen and progesterone inhibit the secretion of FSH and LH by the pituitary gland which prevent further follicles developing</li> <li><input type="checkbox"/> inhibition of FSH and LH is an example of negative feedback control</li> <li><input type="checkbox"/> if there is no fertilisation LH levels drop, causing the corpus luteum to break down, causing a drop in progesterone levels</li> <li><input type="checkbox"/> decrease in oestrogen and progesterone levels cause the endometrium to break down resulting in menstruation</li> <li><input type="checkbox"/> if fertilisation does occur the corpus luteum does not degenerate and progesterone levels remain high</li> </ul>

Lesson(s)	..by the end of the lesson(s) I should know...
fertility	<ul style="list-style-type: none"> <li><input type="checkbox"/> males are continuously fertile with a constant, continuous level of sperm production</li> <li><input type="checkbox"/> female's fertility is cyclical leading to a fertile period of a few days during each menstrual cycle</li> <li><input type="checkbox"/> the time of ovulation can be estimated by the number of days after menstruation, a slight increase in body temperature on the day of ovulation and the thinning of the cervical mucus</li> <li><input type="checkbox"/> infertility treatments and contraception are based on the biology of fertility.</li> </ul>
infertility treatment	<ul style="list-style-type: none"> <li><input type="checkbox"/> ovulatory drugs can be used to stimulation of ovulation by preventing the negative feedback effect of oestrogen on FSH secretion OR mimic the action of FSH and LH.</li> <li><input type="checkbox"/> These drugs can cause super ovulation that can result in multiple births or be used to collect ova for IVF</li> <li><input type="checkbox"/> artificial insemination - Several samples of semen are collected over a period of time. Artificial insemination is particularly useful where the male has a low sperm count. If a partner is sterile a donor may be used</li> <li><input type="checkbox"/> IVF - <i>in vitro</i> fertilisation = Surgical removal of eggs from ovaries after hormone stimulation, mix with sperm, incubate zygotes until they have formed at least 8 cells, then implant into uterus.</li> <li><input type="checkbox"/> Pre-implantation genetic diagnosis (PGD) is used in conjunction with IVF to identify single gene disorders and chromosome abnormalities</li> <li><input type="checkbox"/> ICSI - Intracytoplasmic sperm injection - used if mature sperm are defective or very low in number— the head of the sperm is drawn into a needle and injected directly into the egg to achieve fertilisation</li> </ul>
contraception	<ul style="list-style-type: none"> <li><input type="checkbox"/> contraception is the intentional prevention of pregnancy by natural or artificial methods</li> <li><input type="checkbox"/> contraception includes both physical and chemical methods</li> <li><input type="checkbox"/> physical methods = barrier methods (condom / diaphragm), intra-uterine devices and sterilisation procedures, prevent fertilisation or implantation</li> <li><input type="checkbox"/> chemical methods = oral contraceptive pill, mini pill, morning after pill</li> <li><input type="checkbox"/> oral contraceptive pill contains a combination of synthetic progesterone and oestrogen that mimic negative feedback control, preventing release of FSH &amp; LH and prevent ovulation</li> <li><input type="checkbox"/> progesterone only (mini) pill contains synthetic progesterone which causes thickening of the cervical mucus</li> <li><input type="checkbox"/> morning after pill prevents ovulation or implantation</li> </ul>

Lesson(s)	..by the end of the lesson(s) I should know...
	<input type="checkbox"/> A variety of techniques can be used to monitor the health of the mother, developing foetus and baby
<b>antenatal screening</b>	
	<input type="checkbox"/> antenatal screening identifies risk of a disorder so that further tests and prenatal diagnosis can be offered
<b>ultrasound scan</b>	<input type="checkbox"/> an ultrasound scan is used to produce an ultrasound image <input type="checkbox"/> pregnant women are given two ultrasound scans <input type="checkbox"/> dating scans take place between 8-14 weeks and determine the stage of pregnancy and predict the due date <input type="checkbox"/> dating scans are used with tests for marker chemicals which vary normally during pregnancy <input type="checkbox"/> anomaly scans take place between 18-20 weeks are used to detect serious physical problems in the foetus
<b>blood &amp; urine tests</b>	<input type="checkbox"/> routine blood and urine tests are carried out throughout pregnancy to monitor the concentrations of marker chemicals <input type="checkbox"/> measuring a chemical at the wrong time could give a false positive <input type="checkbox"/> an atypical result can lead to diagnostic testing to determine if the foetus has a medical condition
<b>amniocentesis</b>	<input type="checkbox"/> this is a diagnostic test in which a sample of the amniotic fluid is taken <input type="checkbox"/> amniotic fluid contains foetal cells which are cultured and karyotyped <input type="checkbox"/> Karyotype shows an individual's chromosomes arranged as homologous pairs and used to identify anomalies in the number or structure of chromosomes <input type="checkbox"/> Amniocentesis is carried out later in pregnancy and carries a risk of miscarriage (lower than CVS)
<b>chorionic villus sampling (CVS)</b>	<input type="checkbox"/> This is a diagnostic test in which a sample of cells from the placenta is taken <input type="checkbox"/> sample contains foetal cells which are cultured and karyotyped and used to identify anomalies in the number or structure of chromosomes <input type="checkbox"/> can be done earlier than amniocentesis but has higher risk of miscarriage <input type="checkbox"/> risks and potential decisions after a positive test will be assessed prior to carrying out amniocentesis and CVS

analysis of patterns of inheritance in genetic screening and counselling	
genetic terms	<ul style="list-style-type: none"> <li>□ from N5 Biology you should be familiar with the standard genetic terms - alleles, dominant, recessive, homozygous, heterozygous, carriers, genotype, phenotype, autosomes, sex chromosomes</li> </ul>
patterns of inheritance	<ul style="list-style-type: none"> <li>□ pedigree charts are family trees compiled to analyse patterns of inheritance</li> <li>□ autosomal recessive e.g. cystic fibrosis - rare, males and females equally affected, can skip generations</li> <li>□ autosomal dominant e.g. Huntington's disease - males and females equally, shows up in all generations of affected families</li> <li>□ incomplete dominance e.g. sickle cell disease, males and females equally affected, fully affected form is rare, partially affected form is more common</li> <li>□ sex-linked recessive e.g. haemophilia- gene is on the part of the X chromosome where there is no corresponding y chromosome</li> </ul>
postnatal screening	
	<ul style="list-style-type: none"> <li>□ postnatal screening involves health checks carried out after the birth of the baby</li> <li>□ postnatal screening focusses on specific conditions or abnormalities e.g. PKU</li> </ul>
PKU	<ul style="list-style-type: none"> <li>□ phenylketonuria (PKU) is an inborn error of metabolism caused by an autosomal recessive genetic disorder</li> <li>□ PKU is a substitution mutation resulting in the enzyme which converts phenylalanine to tyrosine being non-functional</li> <li>□ undetected PKU causes problems with mental development</li> <li>□ an individual with PKU is put on a restricted diet lacking phenylalanine</li> </ul>

	..by the end of the lesson(s) I should know...
blood vessels	<ul style="list-style-type: none"> <li><input type="checkbox"/> blood circulates from the heart through blood vessels called <b>arteries, arterioles, capillaries, venules</b> and <b>veins</b> and back to the heart</li> <li><input type="checkbox"/> there is a <b>decrease</b> in blood pressure as blood moves away from the heart</li> <li><input type="checkbox"/> the central space or cavity of blood vessels is called the <b>lumen</b></li> <li><input type="checkbox"/> the lining of blood vessels is a thin layer of cells called the <b>endothelium</b></li> </ul>
arteries	<ul style="list-style-type: none"> <li><input type="checkbox"/> <b>arteries</b> carry blood away from the heart</li> <li><input type="checkbox"/> blood in the arteries is at <b>high pressure</b></li> <li><input type="checkbox"/> the <b>thick elastic walls</b> of arteries allow them to stretch and recoil to accommodate the surge of blood after each heart contraction</li> <li><input type="checkbox"/> the <b>smooth muscle</b> in the walls of arterioles can contract or relax causing <b>vasoconstriction</b> or <b>vasodilation</b> to control blood flow to tissues</li> <li><input type="checkbox"/> arteries have <b>narrow lumens</b></li> <li><input type="checkbox"/> during exercise blood flow to the skeletal muscles increases by the vasodilation of the arterioles supplying them &amp; blood flow to abdominal organs reduces by vasoconstriction of the arterioles supplying them</li> </ul>
capillaries	<ul style="list-style-type: none"> <li><input type="checkbox"/> the role of capillaries is to allow <b>exchange of substances</b> with the tissue cells</li> <li><input type="checkbox"/> capillary walls are <b>only one cell thick</b>, allowing quick and efficient exchange of materials</li> <li><input type="checkbox"/> arterioles deliver blood to a dense network or <b>bed of capillaries</b> in each tissue</li> <li><input type="checkbox"/> the higher pressure in arterioles compared to capillaries results in <b>pressure filtration</b></li> <li><input type="checkbox"/> pressure filtration forces plasma (the liquid part of the blood) out of the capillaries into the tissues forming <b>tissue fluid</b></li> <li><input type="checkbox"/> tissue fluid is similar to blood plasma they contain small molecules, but tissue fluid contains <b>no plasma proteins</b> as they are too large to be filtered through the capillary walls</li> <li><input type="checkbox"/> glucose and oxygen diffuse from tissue fluid into the cells and carbon dioxide and waste substances diffuse into the tissue fluid from the cells</li> <li><input type="checkbox"/> tissue fluid re-enters the capillaries at the venule end of the capillary bed by <b>osmosis</b></li> <li><input type="checkbox"/> pressure filtration removes more water out of the capillaries than osmosis returns, causing an <b>excess of tissue fluid</b></li> <li><input type="checkbox"/> the excess tissue fluid is absorbed by the <b>lymph vessels</b> and passes into the <b>lymphatic system</b></li> <li><input type="checkbox"/> the lymphatic system returns the <b>lymph fluid</b> to the circulatory system</li> </ul>
veins	<ul style="list-style-type: none"> <li><input type="checkbox"/> capillaries merge into one another, producing wider blood vessels called <b>venules</b></li> <li><input type="checkbox"/> venules merge to form <b>veins</b> which carry blood <b>back to the heart</b></li> <li><input type="checkbox"/> the blood in veins is at <b>low pressure</b></li> <li><input type="checkbox"/> the walls of veins are <b>elastic</b> but have a much <b>thinner muscular wall</b> than arteries</li> <li><input type="checkbox"/> the lumen in a vein is much <b>wider</b> than that of an artery</li> <li><input type="checkbox"/> <b>valves</b> are present in veins to <b>prevent the backflow</b> of blood (which may happen due to the blood being at low pressure and flowing against the force of gravity)</li> </ul>

	..by the end of the lesson(s) I should know...
heart structure	<ul style="list-style-type: none"> <li><input type="checkbox"/> the heart has <b>four chambers</b> (left and right atria at the top, left and right ventricles at the bottom)</li> <li><input type="checkbox"/> the right and left side of the heart are separate</li> <li><input type="checkbox"/> the right side of the heart collects the <b>deoxygenated</b> blood from the body and pumps it to the lungs</li> <li><input type="checkbox"/> the left side of the heart collects the <b>oxygenated</b> blood from the lungs and pumps it to the body</li> <li><input type="checkbox"/> the walls of the heart are made of <b>cardiac muscle</b>, which can contract continuously <b>without fatigue</b></li> <li><input type="checkbox"/> there are four <b>valves</b> in the heart which prevent blood flowing back into the heart chamber it just came from</li> <li><input type="checkbox"/> between the right atrium and right ventricle and between the left atrium and left ventricle is an <b>atrio-ventricular valve (AV)</b></li> <li><input type="checkbox"/> at the start of the pulmonary artery and aorta is a <b>semilunar valve (SL)</b></li> </ul>
circulation	<ul style="list-style-type: none"> <li><input type="checkbox"/> body -&gt; <b>vena cava</b> (main vein)</li> <li><input type="checkbox"/> vena cava -&gt; right atrium -&gt; right ventricle -&gt; <b>pulmonary artery</b></li> <li><input type="checkbox"/> pulmonary artery -&gt; lungs -&gt; pulmonary vein</li> <li><input type="checkbox"/> <b>pulmonary vein</b> -&gt; left atrium -&gt; left ventricle -&gt; aorta (main artery)</li> <li><input type="checkbox"/> <b>aorta</b> -&gt; body</li> </ul>
cardiac cycle	<ul style="list-style-type: none"> <li><input type="checkbox"/> the cardiac cycle is the pattern of diastole and systole in one complete heart beat</li> <li><input type="checkbox"/> <b>diastole</b> is when heart muscle is relaxed</li> <li><input type="checkbox"/> <b>systole</b> is when heart muscle is contracting</li> <li><input type="checkbox"/> during <b>diastole</b>, blood returning to the atria flows into the ventricles</li> <li><input type="checkbox"/> <b>atrial systole</b> transfers the remainder of the blood through the AV valves into the ventricles</li> <li><input type="checkbox"/> <b>ventricular systole</b> closes the AV valves and pumps the blood through the SL valves to the aorta / pulmonary artery</li> <li><input type="checkbox"/> in <b>diastole</b> the higher pressure in the arteries closes the SL valves</li> <li><input type="checkbox"/> the opening and closing of the heart valves causes the <b>sounds</b> of the heart beat heard with a stethoscope</li> </ul>

<p style="writing-mode: vertical-rl; transform: rotate(180deg);">cardiac conducting system</p>	<ul style="list-style-type: none"> <li><input type="checkbox"/> the cardiac conducting system is the <b>nervous control</b> of the heart beat</li> <li><input type="checkbox"/> the heart beat originates in the heart itself</li> <li><input type="checkbox"/> the auto-rhythmic cells of the <b>sino-atrial node (SAN)</b> or pacemaker, in the wall of the right atrium set the rate at which the heart contracts</li> <li><input type="checkbox"/> impulses from the SAN spread through the atria causing atrial systole</li> <li><input type="checkbox"/> the electrical impulses then spread to the <b>atrio-ventricular node (AVN)</b>, located in the centre of the heart</li> <li><input type="checkbox"/> impulses from the AVN travel down fibres in the central wall of the heart and then up through the walls of the ventricles, causing ventricular systole</li> <li><input type="checkbox"/> the electrical impulses in the heart can be detected by an <b>electrocardiogram (ECG)</b>, showing three phases (P, QRS &amp; T)</li> <li><input type="checkbox"/> <b>P wave</b> = atrial systole</li> <li><input type="checkbox"/> <b>QRS complex</b> = ventricular systole</li> <li><input type="checkbox"/> <b>T wave</b> = diastole</li> <li><input type="checkbox"/> the <b>medulla</b> of the brain regulates the SAN through the antagonistic action of the <b>autonomic nervous system (ANS)</b></li> <li><input type="checkbox"/> <b>sympathetic</b> accelerator nerves release <b>nor-adrenaline</b>, which increase heart rate</li> <li><input type="checkbox"/> <b>parasympathetic</b> nerves to the heart release <b>acetylcholine</b> which decrease the heart rate</li> </ul>
<p style="writing-mode: vertical-rl; transform: rotate(180deg);">circulatory system measurements</p>	<ul style="list-style-type: none"> <li><input type="checkbox"/> blood pressure is measured using a <b>sphygmomanometer</b>-an inflatable cuff stops blood flow, in the artery, and deflates gradually. The blood then starts to flow (detected by a pulse) at systolic pressure. The blood flows freely through the artery (and a pulse is not detected) at diastolic pressure</li> <li><input type="checkbox"/> a typical reading for a young adult is <b>120/80 mmHG</b></li> <li><input type="checkbox"/> the higher value represents <b>systolic</b> pressure and the lower value is <b>diastolic</b> pressure</li> <li><input type="checkbox"/> <b>hypertension</b> (high blood pressure) is a major risk factor for many diseases including coronary heart disease</li> <li><input type="checkbox"/> <b>stroke volume</b> is the volume of blood pumped out by either ventricle during one systole (the same volume is pumped out by left and right ventricles)</li> <li><input type="checkbox"/> <b>cardiac output</b> is the volume of blood pumped out by either ventricle per minute, it is determined by <b>Heart Rate X Stroke Volume</b></li> </ul>

	..by the end of the lesson(s) I should know...
atherosclerosis	<ul style="list-style-type: none"> <li><input type="checkbox"/> atherosclerosis is the accumulation of fatty material (mainly cholesterol, fibrous material and calcium), forming an <b>atheroma</b> or plaque</li> <li><input type="checkbox"/> an atheroma forms <b>beneath the endothelium</b> of the artery wall</li> <li><input type="checkbox"/> as an atheroma grows, the artery <b>thickens and loses its elasticity</b></li> <li><input type="checkbox"/> an atheroma <b>reduces the diameter of the lumen</b> of an artery which <b>restricts blood flow and increases blood pressure</b></li> <li><input type="checkbox"/> atherosclerosis is the root cause of various cardiovascular diseases (CVD) including <b>angina, heart attack, stroke and peripheral vascular disorders</b></li> <li><input type="checkbox"/></li> </ul>
thrombosis	<ul style="list-style-type: none"> <li><input type="checkbox"/> if an atheroma ruptures, the damage to the endothelium causes the release of <b>clotting factors</b></li> <li><input type="checkbox"/> clotting factors cause the <b>enzyme prothrombin</b> to be converted into its <b>active form thrombin</b></li> <li><input type="checkbox"/> thrombin causes molecules of the soluble plasma protein fibrinogen to form threads of insoluble fibrin protein</li> <li><input type="checkbox"/> fibrin threads form a <b>mesh</b> that platelets adhere to, forming a <b>blood clot</b>, which seals a wound and forms a scaffold for the formation of scar tissue</li> <li><input type="checkbox"/> thrombosis is the <b>formation of a blood clot (thrombus)</b> in a vessel</li> <li><input type="checkbox"/> if a thrombus breaks loose, it forms an <b>embolus</b> that travels through the blood stream until it blocks a blood vessel</li> <li><input type="checkbox"/> thrombosis in a coronary artery can lead to <b>myocardial infarction (MI)</b> commonly known as a heart attack</li> <li><input type="checkbox"/> Thrombosis in an artery in the brain can lead to a <b>stroke</b></li> <li><input type="checkbox"/> thrombosis normally results in the <b>death of some of the tissue</b> served by the blocked artery as the cells are deprived oxygen</li> </ul>

<p style="writing-mode: vertical-rl; transform: rotate(180deg);">peripheral vascular disorders</p>	<ul style="list-style-type: none"> <li>□ peripheral vascular disorders include narrowing of arteries due to atherosclerosis of arteries <b>other than those of the heart or brain</b></li> <li>□ blood clots can result in <b>deep vein thrombosis (DVT)</b> and <b>pulmonary embolism</b></li> <li>□ DVT is the formation of a blood clot in a deep vein, most commonly the <b>lower leg</b></li> <li>□ in DVT pain is experienced in the leg muscles due to limited oxygen supply</li> <li>□ a pulmonary embolism is caused by part of a thrombus breaking free and travelling through the blood stream to the <b>pulmonary artery</b>, where it can cause a blockage resulting in chest pain and breathing difficulties</li> </ul>
<p style="writing-mode: vertical-rl; transform: rotate(180deg);">cholesterol</p>	<ul style="list-style-type: none"> <li>□ cholesterol is a type of lipid found in <b>cell membranes</b> and is used to make the sex hormones: testosterone, oestrogen and progesterone</li> <li>□ cholesterol is synthesised by all cells, 25% of total production takes place in the liver</li> <li>□ a diet high in <b>saturated fats</b> or cholesterol causes an increase in cholesterol levels in the blood</li> <li>□ lipoproteins contain lipid and protein</li> <li>□ <b>High-density lipoprotein (HDL)</b> transports the excess cholesterol from body cells to the liver for elimination (so prevents the build-up of cholesterol in the blood)</li> <li>□ <b>Low-density lipoprotein (LDL)</b> transports cholesterol to body cells</li> <li>□ most cells have <b>LDL receptors</b> that take LDL into the cell where the cholesterol is released</li> <li>□ once a cell has sufficient cholesterol, a <b>negative feedback</b> system inhibits the synthesis of new LDL receptors and so LDL circulates in the blood</li> <li>□ LDL circulating in the blood may deposit the cholesterol in the arteries causing <b>atheromas</b></li> <li>□ <b>higher ratio of HDL to LDL</b> results in lower blood cholesterol and a reduced chance of atherosclerosis</li> <li>□ regular <b>physical activity tends to raise HDL levels</b></li> <li>□ dietary changes aim to <b>reduce the levels of total fat in the diet</b> and to replace saturated fats with <b>unsaturated fats</b></li> <li>□ drugs such as statins reduce the blood cholesterol by <b>inhibiting the synthesis of cholesterol</b> by liver cells</li> </ul>

	..by the end of the lesson(s) I should know...
importance of blood glucose control	<ul style="list-style-type: none"> <li><input type="checkbox"/> Chronic elevation of Blood glucose levels leads to the endothelium cells taking in more glucose than normal, damaging the blood vessels</li> <li><input type="checkbox"/> Atherosclerosis may develop leading to cardiovascular disease, stroke or peripheral vascular disease</li> <li><input type="checkbox"/> Small blood vessels damaged by high glucose levels may result in haemorrhage of blood vessels in the retina (light detecting surface at back of the eye), renal (kidney) failure or peripheral nerve dysfunction</li> </ul>
blood glucose regulation	<ul style="list-style-type: none"> <li><input type="checkbox"/> blood glucose concentration is maintained within fine limits by <b>hormones</b></li> <li><input type="checkbox"/> blood glucose concentration is monitored by receptors in the <b>pancreas</b></li> <li><input type="checkbox"/> the pancreas controls blood glucose levels with the <b>antagonistic hormones insulin and glucagon</b></li> <li><input type="checkbox"/> the hormones are transported in the blood to the <b>liver</b></li> <li><input type="checkbox"/> insulin makes the liver cells <b>more permeable to glucose</b> and activates the conversion of <b>glucose to glycogen</b>, decreasing the blood glucose concentration</li> <li><input type="checkbox"/> glucagon activates the conversion of <b>glycogen to glucose</b>, increasing the blood glucose concentration</li> <li><input type="checkbox"/> during <b>exercise</b>, and the flight or fight responses, glucose levels are raised by <b>adrenaline</b> released from the adrenal glands, stimulating glucagon secretion and inhibiting insulin secretion</li> </ul>

<p style="writing-mode: vertical-rl; transform: rotate(180deg);">type 1 &amp; type 2 diabetes</p>	<ul style="list-style-type: none"> <li>□ type-1 diabetes usually occurs in childhood, is caused by <b>lack of insulin production</b> &amp; is treated with regular doses of <b>insulin</b></li> <li>□ type-2 diabetes is also called <b>adult onset</b> diabetes as develops later in life</li> <li>□ likelihood of developing type 2-diabetes is increased by being <b>overweight</b></li> <li>□ in type 2-diabetes, insulin is still produced but the <b>cells are less sensitive</b> to it, it is linked to a decrease in the number of insulin receptors in the liver, leading to a failure to convert glucose to glycogen</li> <li>□ in both types of <b>diabetes</b> blood glucose concentration will rise rapidly after a meal, the kidneys will remove some of this glucose via the urine</li> <li>□ the presence of glucose in the <b>urine</b> is an indicator of diabetes</li> <li>□ the <b>glucose tolerance test</b> is used to diagnose diabetes, it involves measurement of blood glucose concentrations after fasting, drinking a glucose solution then monitoring blood glucose concentrations over the next two hours</li> <li>□ in the glucose tolerance test blood glucose concentrations of a diabetic usually start higher, reach higher levels and take longer to return to starting levels than non-diabetic</li> </ul>
<p style="writing-mode: vertical-rl; transform: rotate(180deg);">obesity</p>	<ul style="list-style-type: none"> <li>□ <b>obesity</b> is a major risk factor for Cardiovascular disease and type 2 diabetes, and may impair health</li> <li>□ obesity is characterised by <b>excess body fat in relation to lean body tissue</b> (muscle) and is a major risk factor in CVD and type 2 diabetes</li> <li>□ <b>Body Mass Index (BMI)</b> is a measurement of body fat based on height and weight (BMI = weight (kg) divided by height (m) squared)</li> <li>□ BMI over <math>30\text{kgm}^{-2}</math> is obese</li> <li>□ BMI can wrongly classify obesity in muscular individuals</li> <li>□ obesity is linked to <b>high fat diet</b> and a <b>low physical activity</b></li> <li>□ fats have a high calorific value and so should be limited in the diet</li> <li>□ sugar require no metabolic energy to digest them and so should be limited in the diet</li> <li>□ <b>exercise</b> increases energy expenditure and preserves lean tissue</li> <li>□ exercise can <b>reduce risk factors</b> for CVD by keeping weight under control, reducing stress and hypertension and can improve HDL to LDL ratios</li> </ul>
